

San-a-Key®

System

Enterprise Wide Analytics for Infection Prevention

The KSI San-a-Key® **Healthcare Technology** System is the most advanced method for assisting with infection control and the prevention of cross contamination with the patented easy-to-clean button to disinfect the keyboard surface between users. No need to remove the most valuable Electronic Health Records tool, *your keyboard*, from service to wash in a sink or dishwasher. Now disinfect immediately after use. Prevent cross contamination in real time, improve work flow, enhance the user experience and aid in the infection control process.

But what truly sets the Sanakey® System apart from any infection control product, is its real-time analytics, that gives infection control professionals the ability to know when a keyboard surface was cleaned, by whom and at what workstation, throughout the entire hospital. The most unique feature of this patented software is its ability to push desktop reminders to all clinicians that the keyboard they are about to use is in need of disinfecting.

Cleaning Mode

To disinfect the keyboard surface, press the easy clean button once. This action disengages only the keyboard from the computer system (Num lock, Caps lock and Scroll lock LED's will flash simultaneously indicating cleaning mode) This allows you the freedom of wiping the surface without entering errant data. When you are through with the disinfecting process and you are no longer pressing keys the the keyboard comes back to life in 3 seconds.
